ZJU-UIUC Institute Final Exam, ECE 220

Wednesday 2 January 2019

Nam	ne (pinyin and)	Hanzi):
Stud	ent ID:	
• Be su	are that your ex	am booklet has 12 pages.
• Writ	e your name an	d Student ID on the first page.
		tines and an LC-3 ISA guide are provided. Unlike the first atel's Appendix A will not be available during the exam.
• Do n	ot tear the exam	apart other than to remove the last two reference pages.
• This	is a closed book	exam. You may <u>not</u> use a calculator.
• You	are allowed TH	REE handwritten A4 sheets of notes (both sides).
• YOU	MAY NOT US	SE EXTRA PAPER! WRITE ON THE EXAM!
• Abso	olutely no intera	ction between students is allowed.
• Show	v all work, and o	clearly indicate any assumptions that you make.
• Don'	t panic, and goo	od luck!
Problem 1	25 points	
Problem 2	15 points	
Problem 3	20 points	
Problem 4	25 points	
Problem 4	15 points	
Γotal	100 points	

Problem 1 (25 points): Short Answer Questions

1. **(5 points)** The program below was designed to print the number 5 on the LC-3 display. The program does not work. **USING TEN WORDS OR FEWER**, explain why.

```
.ORIG x3000
      JSR A
      OUT
      BRnzp DONE
      AND R0, R0, #0
Α
      ADD R0,R0,#5
      JSR B
      RET
DONE HALT
ASCII .FILL x0030
      LD R1,ASCII
      ADD R0,R0,R1
      RET
      . END
   Answer:
```

2. **(5 points)** As shown below, Prof. Lumetta attempted to simplify the program from **Problem 1.1** above. His version does not work, either. **USING TEN WORDS OR FEWER**, explain why.

```
.ORIG *3000
LD R0,NUM5
STI R0,DDR
HALT
NUM5 .FILL *35 ; ASCII digit '5'
DDR .FILL *FE06
.END

Answer:
```

3. **(5 points)** Prof. Lumetta's new C++ program crashes after main has returned. **USING TEN WORDS OR FEWER**, explain how this behavior is possible.

Answer:	

Problem 1, continued:

4. **(5 points)** Read the code and fill in the outputs below.

```
#include <stdio.h>
typedef void (*func_call)(int);
void callback1 (int a)
   printf ("%d ", a);
void callback2 (int b)
   printf ("%d ", 9 - b);
func_call callback_function;
void foo (int n)
    int i;
   for (i = n; i < n + 3; i++) {
       if (callback_function) {
            (*callback_function) (i);
        }
   printf ("\n");
}
int main ()
   callback_function = &callback1;
   printf ("A: ");
   foo (1);
   callback_function = NULL;
   printf ("B: ");
   foo (3);
   callback function = &callback2;
   printf ("C: ");
   foo (5);
   return 0;
}
Complete the output from the program:
B:
C: ____
```

Problem 1, continued:

5. **(5 points)** Prof. Lumetta has developed a new type of book called a "good book," as shown below.

```
typedef struct book_t book_t;
struct book_t {
    // some stuff
    book t* next;
                                      // for the library
};
typedef struct good_book_t;
struct good_book_t {
    book_t base;
    // some other stuff
    void (*promote_book) (void); // a function pointer for good books
};
And he has a file scope variable with a list of books he owns...
static book_t* Lumetta_library = NULL;
Once he has populated his library with both good books and not-so-good books (plain old book_t's),
he wants to execute the following code...
book_t* b;
for (b = Lumetta_library; NULL != b; b = b->next) {
    good book t* g = (good book t*)b;
    g->promote book ();
}
```

USING FIFTEEN WORDS OR FEWER, explain to Prof. Lumetta why his code keeps crashing.

Problem 2 (15 points): Pareto Dominance with Recursion

This problem is based on the following node structure:

Write a recursive function that, given a pointer to the head of a singly-linked list of dynamically-allocated nodes sorted by their X values (from smallest to largest), removes all Pareto-dominated nodes from the list and frees the removed nodes. Assume that all X values are unique.

A node is Pareto-dominated if another node in the list has smaller or equal values for both X and Y.

A solution is possible using twelve lines of code.

For credit, your function must be recursive.

```
void remove_dominated (Node* head)
{
```

Problem 3 (20 points): I/O in C

In this problem, you must write a C function that processes one file to produce a second file. The input file is specified by the argument fname. The output file must be called out.txt. Your function must read characters from the input file, remove any repeated characters (case sensitive), and write the remaining characters to the output file.

For example, if the input file contains "aaa112234abgFFrrrR" (no quotes), the output file must contain "a1234abgFrR" (again, no quotes) after your function finishes writing it.

- Declare any additional variables that you need.
- Be sure to check for any possible failures and clean up any resources used.
- Return 1 on success, or 0 on failure. (Do not print error messages.)
- Remember that I/O library information is given in the reference sheet at the back of the exam.

```
int32_t file_reduce (const char* fname)
{
    FILE* in; // input stream
    FILE* out; // output stream
    // First, write code to prepare the streams for use.
```

// Read the input file and produce the output.

Problem 4 (25 points): Lists and Hierarchies of Structures

Recall that in class we developed container code for cyclic, doubly-linked lists with sentinels. Later, you made use of the code in a lab.

The node structure for the list appears below, and a diagram of the structure in memory when compiled for LC-3 appears to the right (with offsets).

- 1. **(10 points)** Implement the list insertion code shown below as an LC-3 assembly subroutine. The diagram to the right of the code shows the stack on entry to your subroutine.
 - Do NOT set up a stack frame.

RET

- Use NO MORE THAN SEVEN INSTRUCTIONS (not counting RET, provided for you).
- Your code may change only R0, R1, and R2.
- Do not change R6—the subroutine returns void.
- Hint: if you put the right values into the three registers, you need only one instruction per line of C code.

void		-	
<pre>dl_insert (double_list_t* head, double_list_t* elt) {</pre>		R6 ->	head
			elt
elt->nex elt->pre head->ne	<pre>t = head->next; v = head; xt->prev = elt;</pre>		
nead->ne	xt = elt;		
DL INSERT			
-			
-			
•			
-			
•	-		

Problem 4, continued:

(code and diagram replicated for your convenience)

```
typedef struct double_list_t double_list_t;
struct double_list_t {
    double_list_t* prev; // previous element of list
    double_list_t* next; // next element of list
};
+0 prev
+1 next
+2 next
```

- 2. (10 points) Implement the code shown below to find the first element of a list as an LC-3 assembly subroutine. The diagram to the right of the code shows the stack on entry to your subroutine.
 - Do NOT set up a stack frame.
 - Use **NO MORE THAN TEN INSTRUCTIONS** (not counting RET, provided for you).
 - Your code may change only R0, R1, R2, R3, and R6.
 - Be sure to push the return value on top of the stack.

vola*		R6 ->	head
<pre>dl_first (do {</pre>	ouble_list_t* head)		
	<pre>head == head->next ? NULL : head->next);</pre>		
DL_FIRST			
			
	RET		

3. **(5 points)** Prof. Lumetta has another issue. He has implemented a list of 3D points using the doubly-linked list code. Here is his structure definition:

Here's the problem: after he fills in the coordinates for a point, he inserts the point into a list using dl_insert. The insertion seems to work fine, but when he looks at the coordinates of the point, they have changed! USING TEN WORDS OR FEWER, explain the problem.

Problem 5 (15 points): C++ Call Sequencing

Read the code below.

```
#include <stdio.h>
class THING {
    int x;
public:
    THING () : x (1) {
        printf ("ONE ");
    THING (int val) : x (val) {
        printf ("%d ", val);
    THING& operator= (const THING& t) {
        this -> x = t.x + 10;
        printf ("= %d", this->x);
        return *this;
    friend THING operator+ (const THING& t, const THING& u) {
        printf ("-> ");
        return THING (t.x * u.x);
    }
};
THING* function ()
    printf ("line 1: ");
    THING t(1);
    printf ("\nline 2: ");
    THING u = (t + 3) + 5;
    printf ("\nline 3: ");
    return new THING (u + (7 + 9));
```

1. (10 points) Fill in the blanks below with the rest of the output produced when the subroutine function is called:

line 1:	
line 2:	
line 3:	

Problem 5, continued:

(code replicated for your convenience)

```
#include <stdio.h>
class THING {
    int x;
public:
    THING () : x (1) {
        printf ("ONE ");
    THING (int val) : x (val) {
        printf ("%d ", val);
    THING& operator= (const THING& t) {
        this -> x = t.x + 10;
        printf ("= %d", this->x);
        return *this;
    friend THING operator+ (const THING& t, const THING& u) {
        printf ("-> ");
        return THING (t.x * u.x);
    }
};
THING* function ()
    printf ("line 1: ");
    THING t(1);
    printf ("\nline 2: ");
    THING u = (t + 3) + 5;
    printf ("\nline 3: ");
    return new THING (u + (7 + 9));
}
```

2. (5 points) Prof. Lumetta has a dilemma. He wrote the main function below. He wants to follow the "C++ style" and declare **THING U** as shown, but the assignment produces no output! He has noticed that if he puts the declaration at the top of the function, as with **THING T**, output is produced when **T** is assigned a value.

```
int main ()
{
    THING T;
    THING* ptr = function ();

    T = *ptr; // this line produces output
    THING U = *ptr; // this line does not!

    delete ptr;
    return 0;
}
```

USING FIFTEEN OR FEWER WORDS, explain the problem.

some of the routines from C's standard I/O library

```
// returns new stream, or NULL on failure
FILE* fopen (const char* path, const char* mode);
// returns 0 on success, or EOF on failure
int fclose (FILE* stream);
// returns char, or EOF on failure
int fgetc (FILE* stream);
// returns s, or NULL on failure
char* fgets (char* s, int size, FILE* stream);
// returns # of elements read, or 0 on failure
size t fread (void* ptr, size t size, size t nmemb, FILE* stream);
// returns # of conversions, or -1 on failure (no conversions)
int fscanf (FILE* stream, const char* format, ...);
// returns # of conversions, or -1 on failure (no conversions)
int sscanf (const char* str, const char* format, ...);
// returns c, or EOF on failure
int fputc (int c, FILE* stream);
// returns value >= 0 on success, < 0 on failure
int fputs (const char* s, FILE* stream);
// returns # of elements written, or 0 on failure
size t fwrite (const void* ptr, size t size, size t nmemb,
               FILE* stream);
// returns # of characters printed, or negative value on failure
int fprintf (FILE* stream, const char* format, ...);
// returns # of characters printed, or negative value on failure
int snprintf (char* str, size_t size, const char* format, ...);
```
